Actuarial Life Table. A period life table is based on the mortality experience of a population during a relatively short period of time. Here we present the 2017 period life table for the Social Security area population . For this table, the period life expectancy at a given age is the average remaining number of years expected prior to death for a person at that exact age, born on January 1, using the mortality rates for 2017 over the course of his or her remaining life.

The actuarial present value (APV) is the expected value of the present value of a contingent cash flow stream (i.e. a series of payments which may or may not be made). Actuarial present values are typically calculated for the benefit-payment or series of payments associated with life insurance and life annuities.

### **Actuarial present value - Wikipedia**

Actuarial reserves are the amount of money that an insurance company saves in order to be able to pay for all the expenses and claims that it expects it will have to pay in the future. This is only the amount in addition to any premiums that will be paid from the policy holder to the insurance company.
