Diffusion is the movement of particles (ions or molecules) from a region where they are in higher concentration to a region where they are in lower concentration down a concentration gradient. The rate of diffusion depends on the following factors: The concentration gradient - the steeper the gradient the faster the rate. The size of

Osmosis is the diffusion of water through a semipermeable membrane according to the concentration gradient of water across the membrane. Whereas diffusion transports material across membranes and within cells, osmosis transports only water across a membrane and the membrane limits the diffusion of solutes in the water.
